Above data' s is given as :-

Light Dependent Sensor(LDR) work on the principle of ohm's law,

ohm's law says that, At constant temperature, Voltage or Potential difference is directly proportional to the current passing through a circuit,

$$V = I R$$

Higher the voltage higher the resistance,

In the same way -

Standard formula to find the voltage consumed by Bolt IoT module:

$$\text{Voltage 3v3 pin} = \text{Analog A0} / 1024$$

$$\begin{aligned} \text{Thus,} \quad V &= 3.5 / 1024 \\ \text{we get,} \quad \text{Voltage} &= 3.41 \text{ mV} \end{aligned}$$

$$\text{Average data/light} = 3.5$$

Thus, Higher the voltage lower the Light intensity.
